

International Consultation on Incontinence-Satisfaction (ICIQ-S)

Summary

The ICIQ-S assesses aspects of experience, expectations, and outcomes to evaluate satisfaction after urological surgery. After further testing, the intention is for the ICIQ-S to be widely applicable for use in clinical practice and research after both urological and gynaecological surgical procedures. A further questionnaire to assess patient satisfaction after urological investigations (e.g. urodynamics) is also under development.

Number of items: 14

Time to complete:

A few minutes

Level of validation according to ICI grades of recommendation:

Not assessed

Items and scoring:

A scoring system has been derived that consists of two parts: a score for the evaluation of satisfaction with 'surgical outcomes' (ICIQ-S outcome score, range 0-24); and the overall satisfaction with surgery item, scored 0-10. The other seven standalone items for experience and expectations may be used according to clinical circumstances.
